## Laurence Dresgan

A fev days ago, the giant tel sscope at Palomar was dedicated. This telescope took twenty years to build and cost an immense mount of money.

The question Immediately occurs: why was this new, menmoth, telescope built anyhom Don't we already know enough about the stars?

The answer to this question is the answer to man's thirst for mowledge, that unguenchable urge to find out more and more about the morld in which we live.

In the Stone Age, man wes engrged in a daily struggle Just to keep slive. He had to contend with wild animals, gnawing hunger, and often a perverse nature.

In far too many parts of the world today, man is still in the stone age and expends all his energy just in keeping alive. But in other parts, where tools have liberated him, this singleness of purpose hes been supplanted by other motives, among tham the urge to explore the unknom, to push out the frontiers of learning into new areas.

We all know in what fisld knowledge has made its most spectacular sdrance. It is atomic energy. Although any expleration of the unknown requires courage, I nonder whether we all appreciate the awful gamble that the atomic scientists took when they set off the first bomb outeide Alamagordo. They were not sure whether the coolness of the atmosphere nould be sufficient to carry awsy the Intense heat of the bomb. Some seigntists thought the heat generatad would be so great, and so concentrated, that it might set off a chain reaction that would envelop the earth - and us tog. The dectsion mas made to go ahead, earen though it might have meant the end of the world. Al though military considerations undoubtediy determined that deeiston, I sm certain thet had it been peacetime the decision would finally have been the same - to go ghead. Knowledge is dengerous, and discovering it is dangerous, but no effort to
contain it or to limit man's reaching out into the unknom mill ever for long succeed.

If the atomic bomb opened up a new world of knowlsdge, it al so revealed. With staric clarity that our knowledge of the natural sciences has outstripped our ability to use this mowisige constructively. There is nothing new about this aituation. It has ugually been the case. There has usually been a ise between great scientific discovery or invention and its use or control for the benefit of mankind. The only difference today is that the lag has become larger, the cap has widened, because of the rapidity with which now selentific knowledge has been gained and applied.

You have all seen the certoons that depict large heeds of th tiny bodies. We are like that. We have amassed a lot of brain power but it is not being used to build a robust, heal thy social body.

Please do not misunderstand me. I not adrocating a truce on scientific research, but I an sdvocating greater attention to the ways in which we can benefi dally use what we already know and to undertake research about our society, domestic and international.

To illustrate what I nean, lot us take a look at the radio. This is certainly an extraordinary scientific discovery, bat who is the man bold enough to say that it has midened man's horizon? Its mainstay is the soap opera. If ever there was a playing dow to the lowest comon denominator that is it. There is no challenge to the intellect and its recreational sppeal is so poor that there are no repeats. A redio show goes into the Itmbo of forgotten performances just as soon as completed.

The radio undoubtedly has a creat future both for educstion and recration, but so far we have not known how to use it constructively. It has broken down old cultural standards, which, to be sure left much to be desired, but it has not wubstituted in their place standards even as high.

This disintegration process is so interwoven with the warp and woof of modern ife that it may not be easily identified by us but if you will look at a primitive culture that has been exposed to the soap opera, the Hollymood. boy meets girl sequance, the comics and bubble gum, you find a breaking up of the traditional values - the simple dignity and quiet integrity and the sense of membership, of participation in a community where each has his place and his respensibilities. Instead there is conscious aping of habits and customs totally foreign to their om and totally unsuited to their needs.

What we need is the same intensive aplication to the social sciences and the muanities that we give to the natural seiences. We need to know more about ourselves - our cultural heritage and the organizstion of our society. For example, we need to know more about the tensions get up by the radio and the movies with their smphasis on high-powered life. Do they ereate dissatisfactions with the home environment and exactly what is the nem image that they creater

Let us turn to another scene to 1llustrate the need for knowledge about our institutions - from the family to the United Nations. 若veryons in this audience is getting enough to eat, but twothirds of the morld's population 1s hungry. Wveryone here can turn on the faucet and get fresh, cleen water but most of the people of the morld drink contaminated water. Jueryone here can road and write - but in some of the most populous parts of the werld less than $5 \%$ of the people are iiterate.

With the knowledge at our command, we could go far tomards alleviating those dismal conditions. But instead, not three years after Hiro ohima, the horrors of the atomic bomb seem to have sardonically feded away - much like the grin of the Cheshire cat, and our main pre-occupation once again is with confliet and war. The money and affort now going into amament though possibly necessary could go a long ways toward whipping disease and mainutrition and ililteracy.

Well. what can be cone sbout it, you ask.
Obviousiy, one thing mast have and uge is an international organization for the peaceiul settisment of dilsputes. The question is what kind of organization. How tauch reliance should bo put on machinery - on legal formulas and how much on compownding mowledege, undergtanding and jugtioe?

At the pregant time we have the United Tations. Just because the United *ationg hasn't selved the world's troubles, there is a tendency to blane the Charter. It! the veto, people say. Get rid of the veto, snd all will be well.

Now, the fact is that the veto is in the Charter as much because of our insistenco as becanse othor countries insisted on it. The fear was that we would be outvoted so that to protect ourselves from belng pushed around we needed the veto. Please recall that this fear of being outvoted was the principal attack of the opponents of the Lemgue of vations. In 1920 these people screaned so loudy about this that twonty-five years latar the Unt ted States delegaten did obel sance to the myth. The veto $i$. not in the Charter becange the Russians insistad upen it alone. It is there bacense we thought we needed it to pretect us from majority combinations.

Now that we find we were so completsly mong, that we are part of a majority, veices are declaiming that the reto should be benned. Out with the veto and all w111 be wel1.

How simple thi all sounds, yot how completely barren and sterilef As though a change in legal formula were the answer. The Charter could be amended to eliminate the veto, but would Mussia then stay a member of the United Hations? The United Nations without Nussia would be just about as vital as the lesgue of Wations was without the United States.

A page from our own history is ingtractive. After several years of progressive disintegration under the Articles of Confederation, we adopted the constitation. The change worked. Was this because we as a people had cast off one constitutional
coat and put on another one or because our understanding of the requirementg had changed and with that a wilingness to try new political clothing?

I think it was the latter - the new form came cloger to filling our needs than the old ones. Se it will be with the United Nations. If changes in the Oharter are necessary, they will only have meaning when there is a greater knowledge of other peoples - by all peoples - and a greater appreciation of the values of cooperation.

This brings me back to my theme, the need for mere lonowledge of our society and the world we live in. Mow knowledge is not simply book learning. Knowiedge is also understanding. Bingtain's formulas an be lacrned by heart but what good are they unless you understand what they meant It is essy onough to learn that the French are a logical people and that the British are practical, but unless you can interpret these generalities they lose all meaning whatsoever. In brief, the cold facts are useless excopt in terns of the meaning we as individuals derive from them.

I monder whether the United. States today is not in the position of having amassed lots of facts and figures about the world whout understanding what they mean. We are justly proud of our librarieg which are stoeked with the beat of world leamine but how great has been our comprehension of the wistom in these books? We have a high rate of 11 teracy in this country. Milliong read the newspapers every day but how much of what they read do they understands

If I have a doubt on this score it is becsuse we are proceeding just as though the world mere not topsy-tarvy with kaleidoscopio change. It is my impression that despite the excellent news coverage of the great press aszociations and the comentaries of many penotrating writers, we don't undergtand that a nev world is being born and that it differs greatly from the insular world of the United states.

As to the fact of a world upheaval that is changing rapidly what has gone before, let me quote Marshall smats:
"We have passed over from the old feudel vorld. Mankind
is on the march, ifterally, mally and mentally an never
before. This is the century for searching and seeking, the century for making experiments."

How right Marshall Smuts is. Burma, the Philippines, Indis and Falciston gaining independence, Latin Ameri ca experimenting in new political and economic forms for developing resources and raising living standards; illiteracy being attacked on a mass acale everywhere, western zurope trying new techniques of govermantal control and operation of production. If there is a grand motif in this process of searching and seeking, it certainly is the welling up of people, searching for a better life both materially and spiritually. And if any technique for achieving this can be discerned, it is government action expanding the area of government concern and responsibility, and increasing government extension into the control and operation of productive facilities. Most people would call what is going on a movement to the left, some may call it to the right, bit whether left or right it is a fact - a fact that we may choose to ignore but which msy well determine what sort of a country we have a generation or two from now.

Important as domestic matters are, the future of our country will be determined by the turn that other countries take at this Juncture. This makes it imperative that ne learn about the world quickly - and by learning I repeat that I mean more than simply assessing facts. I moan understanding those facts and resching working hypothesis on the basis of study of those facts.

If I had one wish for you that I coula tranglate into reality it would be that each of you have a year of study in some foreign country. There is a wonderful Indian saying all of us might adopt as our motto. It is: uyudge no man until you walked two weeks in his moceasins." A year of living, working and sharing with other peoples would give you an insight into the hopes and frustrations, the formes and techniques of mankind on the march." The part of the work would not
make much difference. Whether Latin Amesica, Burope, Asia or Africs, you mould find a ferment at mork that oxprogsee a resohing out of pooples for something better than they had before and an expectation that their governments will do something to provide it. You will conclude, I an sure, that wother we like the nature or form of this experimentation, it is bound to influence the kind of lifo we heve here in the Uni ted states.

Too few of gou - alas - mill have this op ortunity. Most of you will renain right here. Tot right here tione is an oppertunt ty - not so easy, not so elearcut but still an opportunity. No one denies that it is easier to learn another language living in the country where it is spoken, but it can be done here in New Tork city. The techniques developed during the war to teach foreigo languagas have shom that the learning proceas can be anazingly sacelarated and a real facility for speaking imparted vary quickly. Language is the key to the undergtanding of the cul.ture of any foreign country. It will open doors and vistas that no interpreter esn ever do.

There is also the opportuity for developing an understaxaing of all peoples right here at home. It is natural for any country to fudge nother by the stendards and customs which are a pert of its own birthright. Te in the Onited States are particularly prone to doing thi $z$ bacausa country not hemmed in by othar countrios as is the case in wurope. In making judgoents of other peoples, thereforc, I ask you to peuse and ask yourself the question "why" before reaching any conclusions. This is one of the first questions soked by a child, and in ovaluating the judgments of foreign people it could well be the first question that we should ank ourselves.

We live in a morla filled with mass moverents of one kind or another and yet the message I should like to leave wh th you is a very old message. It is one of individual responsibility. It is that in times of origis such as these, all
our puzzlenent and confusion oan be made to vanish whon we caso to know that our firgt duty is to understand our tises and then to see that there een bo no other basis for the better world that is in all our dreans, except the filling and eager acceptance of every one of us of our part in bringing this drean to realization.
